

Alignment Simulator

Shaft alignment training simulator for both laser and dial indicator methods of alignment. Our new design allows you to make both horizontal and vertical adjustments without the use of any hand tools or shims.

Turbine Measurement

For straightness measurement of bearing journals, turbine diaphragms and shells with a measurement resolution of 0.001 mm [0.05 mils]. The D660 standard system will span diameters from 150 mm to 1700 mm [5.9 - 66.9"]. Measurement distance up to 40 m [132 feet].

The system automatically calculates the position of the bores in both the horizontal & vertical direction and can build in your desired "offset". Up to 600 measurement locations can be stored.
